PATIENT'S FACT SHEET

Weight and Fertility

Being overweight or obese may reduce a woman's fertility. When pregnancy is achieved, excessive weight increases risks associated with pregnancy. Weight loss may improve fertility and pregnancy outcome.

A body mass index (BMI) of 25 to 29.9 is considered overweight, and obesity is defined as a BMI of 30 and above.

		Normal										Overweight					Obese					Extreme Obesity															
BMI		19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54

Fertility issues with obesity

- Irregular or infrequent menstrual cycles.
- Increased risk of infertility.
- Increased risk during fertility surgery.
- Increased risk of miscarriage.
- Decreased success with fertility treatments.

Potential pregnancy complications with obesity

- Increased risk of high blood pressure.
- Increased risk of diabetes in pregnancy.
- Increased risk of birth defects.
- Increased risk of high birth-weight infant.
- Increased risk of Cesarean section.

Benefits of weight loss

- Weight loss of 5% to 10% may dramatically improve ovulation and pregnancy rates.
- Improved health including reduced diabetes, high blood pressure, and heart disease.
- Improved self-esteem.

Weight loss involves a serious commitment involving a healthy diet and exercise. Help is available from your health care professional.
